Endometriosis

Definition:

Endometrial tissue outside endometrium

Prevalence:

10% of all reproductive age women

50% **infertile** women

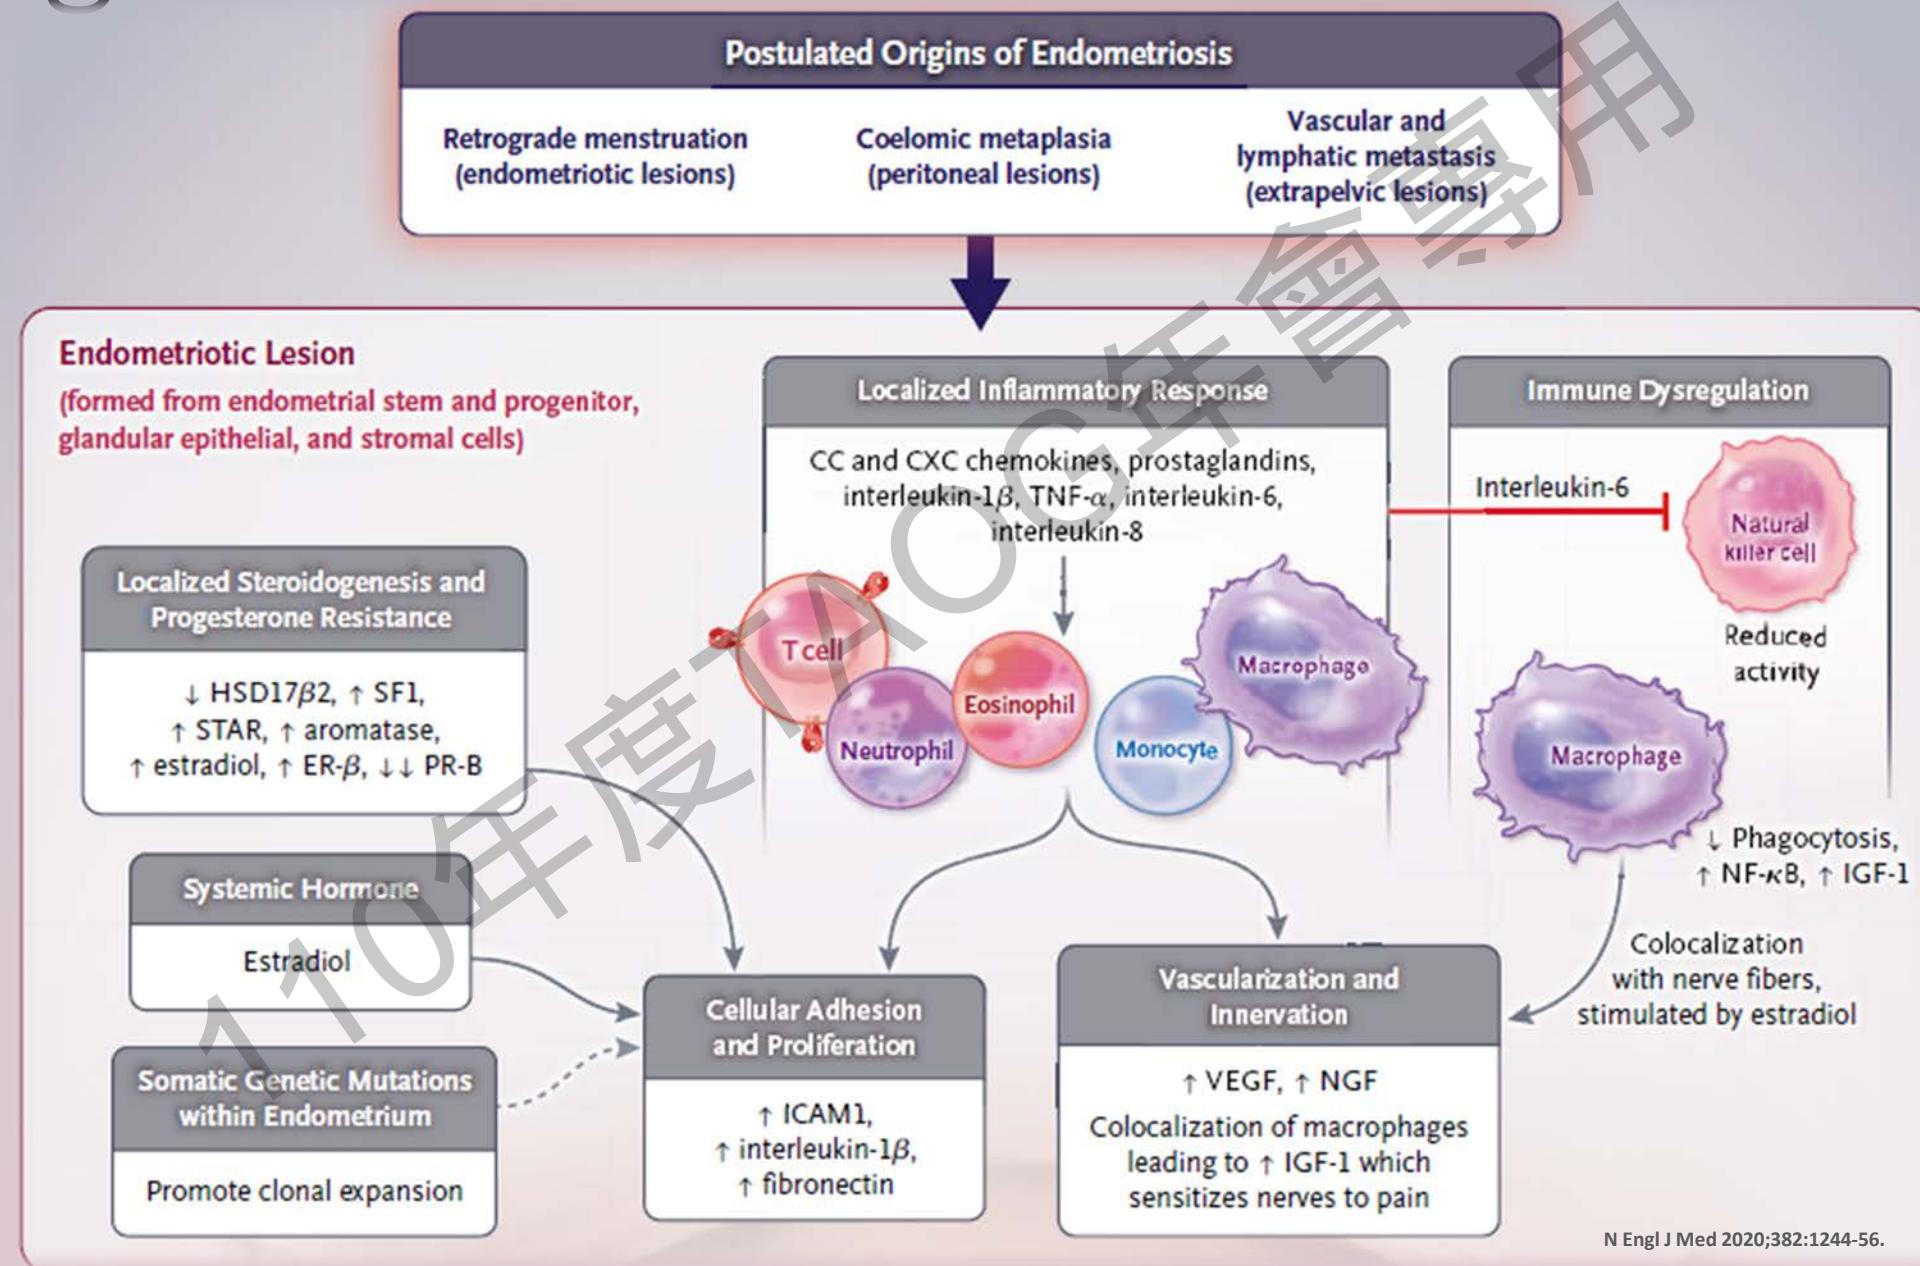

20% pelvic **pain** women

Symptoms:

Pain: Chronic pelvic pain, dysmenorrhea, dyspareunia...

Infertility

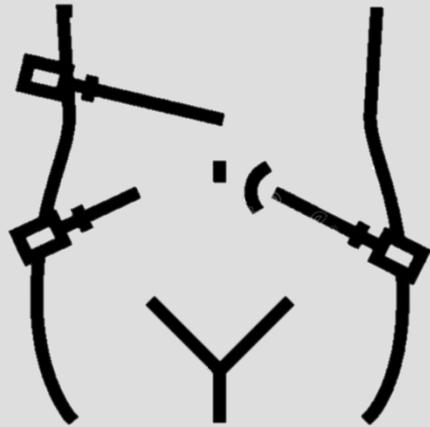

Pathogenesis

Diagnosis of endometriosis

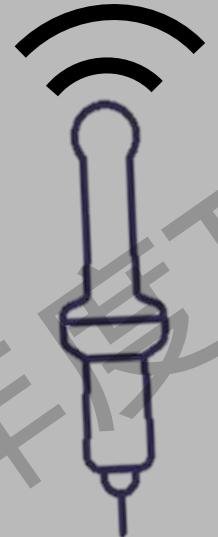

Laparoscopy

Gold standard

Ultrasound

Good at
endometrioma or
DIE

MRI

Good; no cost
effectiveness

History / PE

Delayed diagnosis due to non-specific symptoms, no specific bio markers...

Before Management

Practice Committee of the ASRM :

Endometriosis should be viewed as a chronic disease that requires a **life-long management** plan with the goal of maximizing the use of **medical treatment** and **avoiding repeated surgical procedures**.

Fertil Steril 2014;101:927–35

Medical treatment not curative but **suppressive**

Recurrent symptoms around 50% of over a period of 5 years, irrespective of the treatment approach.

Management

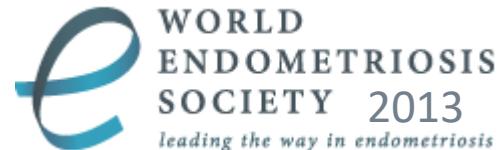

2010

The American College of
Obstetricians and Gynecologists
WOMEN'S HEALTH CARE PHYSICIANS

2013

2014

2017

Medical treatment

- Non-hormone therapy, NSAID
- Hormonal therapy: COC, Progestin, GnRH agonist/ antagonist, others

Surgical treatment

- Medical treatment failure
- Surgical treatment of endometrioma
- Surgical treatment of DIE

Post operative medical treatment

- Post operation medical therapy for prevention recurrence

Management - pros and cons of Mx

© 2021 UpToDate, Inc. and/or its affiliates. All Rights Reserved.

Medical treatment for pelvic pain in endometriosis

Advantages
Avoids risk of damaging pelvic organs during surgery
Avoids risk of postoperative adhesion formation
Treats implants not visualized during surgery
Disadvantages
Side effects of medications
High recurrence rates after discontinuation
No effect on existing adhesions
No effect on endometriomas
Treatments involving suppression of ovulation also prevent pregnancy during the treatment period
No effect on infertility

Medical treatment

Non-hormonal therapy

Nonsteroidal anti-inflammatory drugs(NSAID)

NICE : short trial (for example, 3 months) of paracetamol or a NSAID

ESHRE : recommends considering use

ASRM : 1st line

WES : empirical 1st line as well as other analgesia and COC

AEs

Cochrane Database of Systematic Reviews

Nonsteroidal anti-inflammatory drugs for pain in women with endometriosis (Review)

2017

Only 1 trial, endometriosis: Compare Naproxen to placebo
No clear evidence to endometriosis
Effective for primary dysmenorrhea

Medical treatment

Non-hormonal therapy

Table 1. Investigated drugs for the treatment of endometriosis.

	Class	Drugs	Most advanced study
Hormonal treatment	GnRH antagonist	Cetrorelix ⁽¹⁾ , elagolix ⁽²⁾	III ^(1,2)
	Aromatase inhibitors	Anastrozole ⁽¹⁾ , letrozole ⁽²⁾	III ^(1,2)
	SERM	Bezedoxifene ⁽¹⁾ , raloxifene ⁽²⁾	II ^(1,2)
	SPRM	Mifepristone ⁽¹⁾ , anoprisnil ⁽²⁾	II ^(1,2)
Anti-angiogenic drugs	Anti-VEGF	Bevacizumab ⁽¹⁾	Animal model ⁽¹⁾
	TKIs	Sunitib ⁽¹⁾ , Sorafenib ⁽²⁾ , Pazopanib ⁽³⁾	Animal model ^(1,2,3)
	mTOR	Rapamycin ⁽¹⁾ , Temsirolimus ⁽²⁾ , Everolimus ⁽³⁾	Animal model ^(1,2,3)
	Dopamine agonists	Cabergoline ⁽¹⁾ , quinagolide ⁽²⁾	II ^(1,2)
Anti-inflammatory	Others	TNP-470 ⁽¹⁾	Animal model ⁽¹⁾
	COX-2 inhibitors	Parecoxib ⁽¹⁾ , celecoxib ⁽²⁾	Animal model ^(1,2)
	Anti TNF-α	Etanercept ⁽¹⁾ , infliximab ⁽²⁾ , TNFRSF1A ⁽³⁾ and c5N ⁽⁴⁾	Animal model ^(1,3,4) , phase II ⁽²⁾
	MAPK inhibitors	SB203580 ⁽¹⁾ , FR167,653 ⁽²⁾	Animal model ^(1,2)
Immunomodulators	NfKb inhibitors	IκB protease inhibitor (TPCK) ⁽¹⁾ , BAY 11–7085 ⁽²⁾ , urinary preparation of human chorionic gonadotropin A (hCG-A) ⁽³⁾ , pyrrolidinedithiocarbamate (PDTC) ⁽⁴⁾ , costunolide ⁽⁵⁾ , curcumin ⁽⁶⁾ , DLBS1442 ⁽¹⁾ , imiquimod ⁽²⁾ , bentamapimod ⁽³⁾ , V-endo ⁽⁴⁾	Animal model ^(1,2,3,4,5,6) , III ⁽⁷⁾
	Others	Endostatin ⁽¹⁾ , simvastatin ⁽²⁾ , atorvastatin ⁽³⁾ , rosuvastatin ⁽⁴⁾	Animal model ^(1,2,3,4)
	Statins	Metformin ⁽¹⁾ , ciglitazone ⁽²⁾ , pioglitazone ⁽³⁾ , rosiglitazone ⁽⁴⁾	Animal model ^(1,2,3,4)
	Antidiabetic drugs	Eocalcitol (Vit D) ⁽¹⁾ , retinoic acid (Vit A)	Animal model ^(1,2)
Antioxidants drugs	Vitamins	Omega-3 fatty acids ⁽¹⁾ , N-acetylcysteine ⁽²⁾ , α-lipoic acid ⁽³⁾	Animal model ^(1,3) , II ⁽²⁾
	Other antioxidants	Trichostatin A ⁽¹⁾ , valproic acid ⁽²⁾	Animal model ^(1,2)
	Histone deacetylase inhibitors		
Epigenetic drugs			

GnRH: gonadotropin releasing hormone; SERM: selective estrogen receptor modulator; SARM: selective androgen receptor modulator; NFKB: nuclear factor kappa B; MAPK: mitogen-activated protein kinase; PDTC: pyrrolidinedithiocarbamate; V-endo: vandetanib; I: tyrosine kinase inhibitors; MAPK: Mitogen-activated protein kinase

Estrogen :
negative feed-back
X ovulation

Progestin :
X ovary steroidogenesis
endometrium implants
decidualization
atrophy
apoptosis

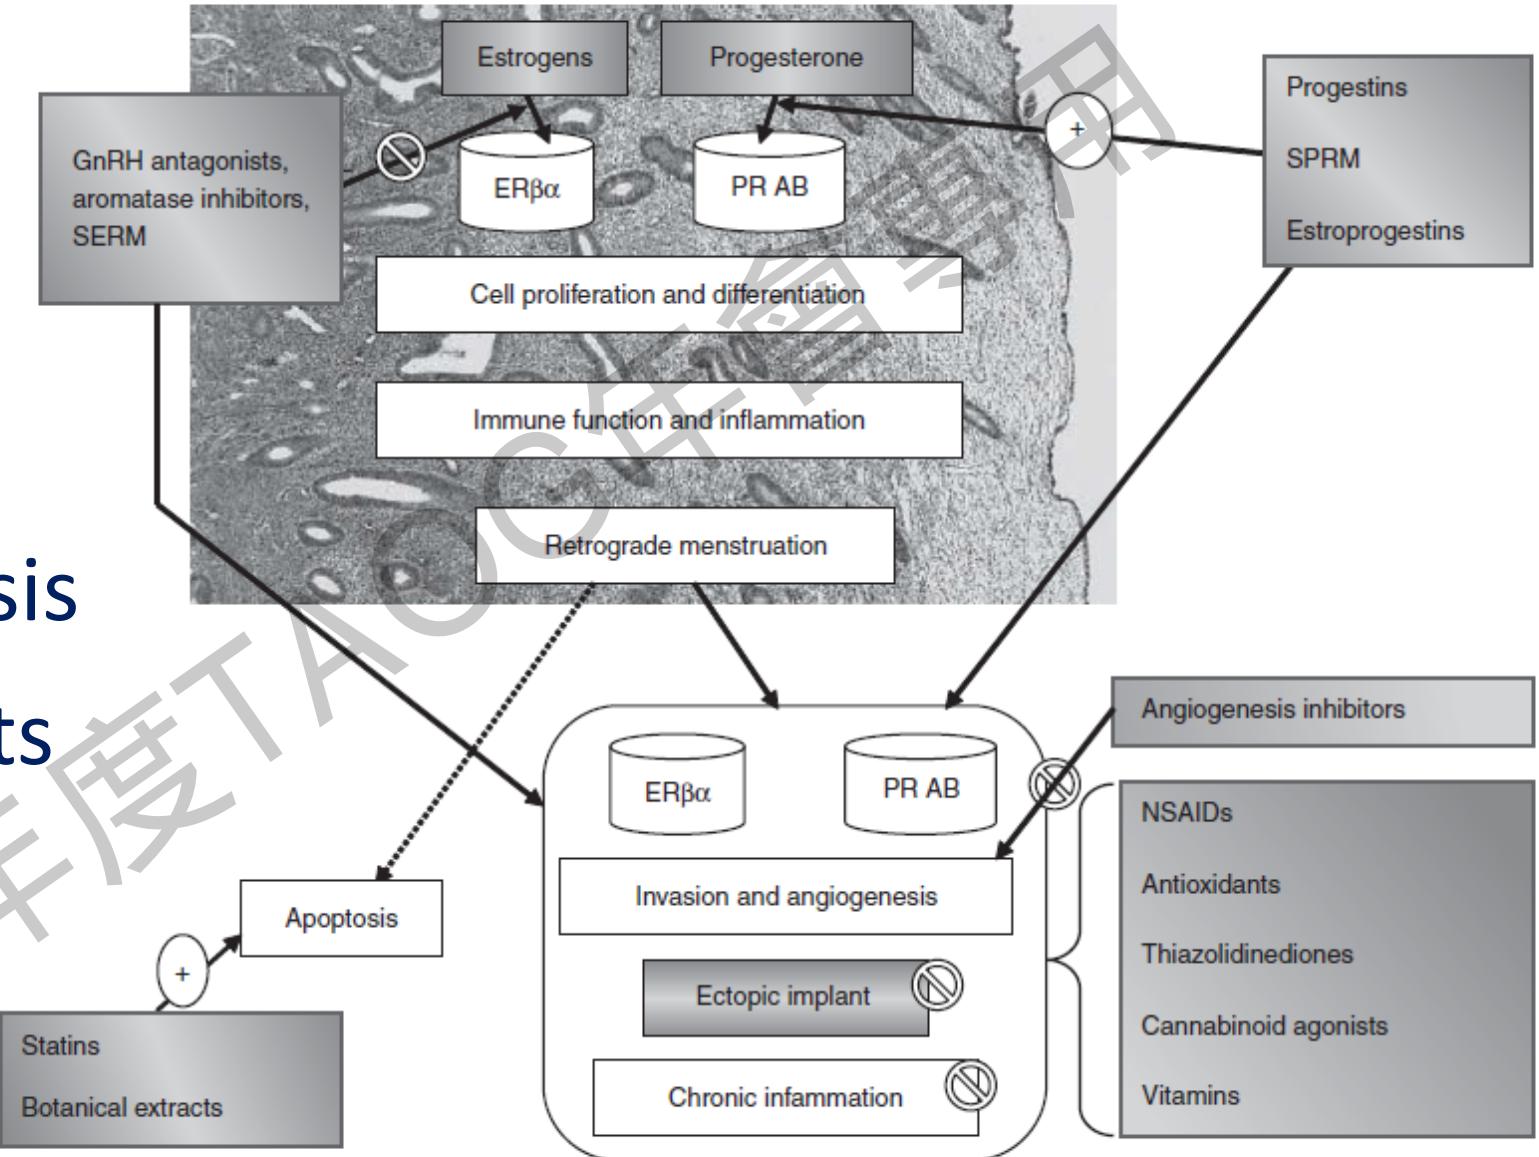

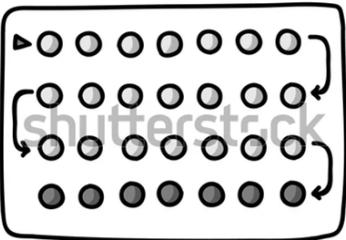

Figure 1. Pathogenesis of endometriosis and mechanisms of action of new treatments.

Medical treatment Hormonal therapy - COC

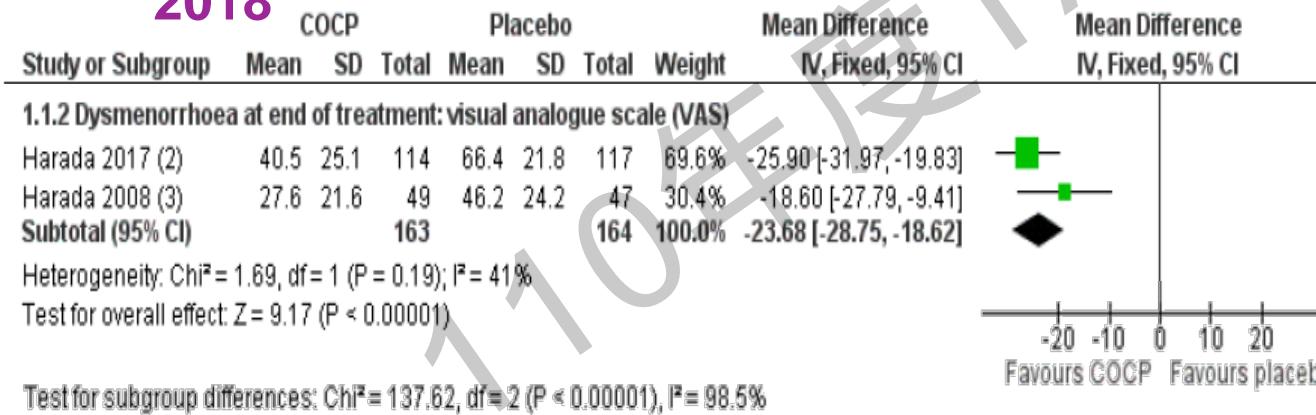

1st line hormone therapy; No one COC better than another

Begin with low dose 20~30mcg ethinyl estradiol, continuous use > cyclic use

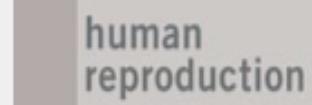

Two trials, 354 women, COC v.s placebo,
improvement in self-reported dysmenorrhea

Medical treatment Hormonal therapy - COC

Human Reproduction, Vol.26, No.8 pp. 2028–2035, 2011

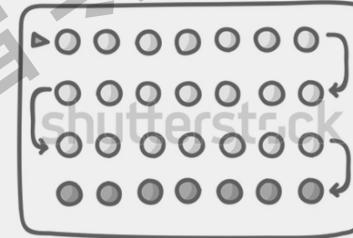

Advanced Access publication on June 4, 2011 doi:10.1093/humrep/der156

ORIGINAL ARTICLE Gynaecology

Past COC user for primary dysmenorrhea
=> ↑ endometriosis and ↑DIE

5mcg EE ~ 0.625 mg CEE~ 1mg micronized estradiol
20-30 mcg EE => 4-6 X physiology estrogen
Supraphysiology estrogen

Progesterone pills may be better first-line treatment than COC
for endometriosis

Robert F. Casper, M.D.

Published: February 02, 2017 • DOI: <https://doi.org/10.1016/j.fertnstert.2017.01.003> •

Medical treatment

Hormonal therapy - Progestins

Norethisterone acetate (NETA)

Dienogest

Levonorgestrel (LNG-IUS)

Medroxyprogesterone acetate

Proved to be effective,
NETA ~ Dienogest but costs ↑

Management

Other hormonal therapy

2nd line Hormonal therapy

- GnRH agonist +/- add back
- LNG-IUS
- Gestrinone
- Danazole
- Aromatase inhibitor
- Selective progesterone receptor modulator
- Selective estrogen receptor modulator
- GnRH antagonist

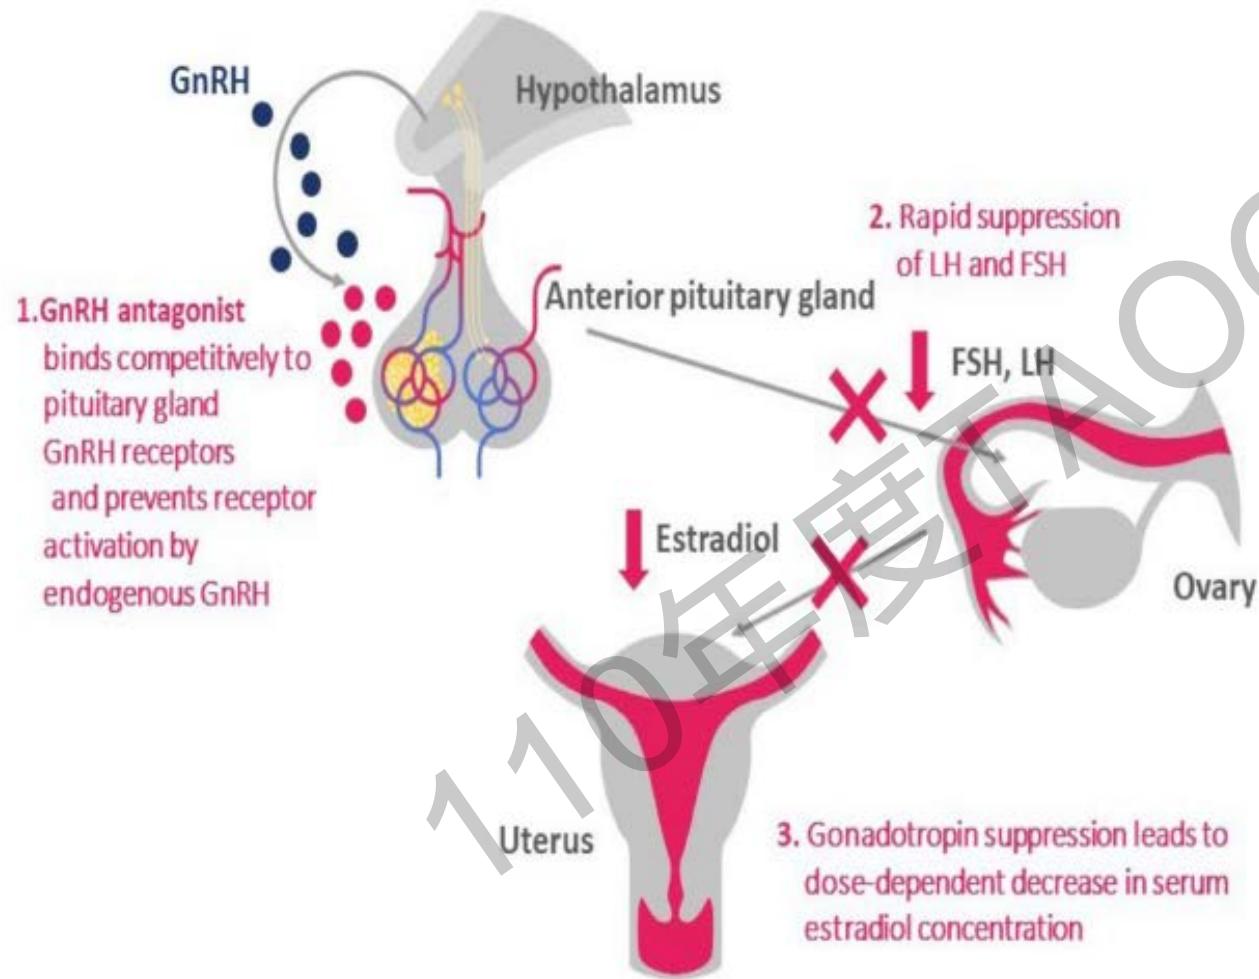

Table 1. Current drug class of the treatment of endometriosis.

Drug class	Advantages	Disadvantages
NSAIDs	<ul style="list-style-type: none">• First-line therapy• Efficacious in improving moderate women pain symptoms• Not expensive	<ul style="list-style-type: none">• They only act on symptoms• Does not block of ovulation
Estropiogestins	<ul style="list-style-type: none">• First-line therapy• Not expensive• Low rates of AEs• Multiple route of administration available	<ul style="list-style-type: none">• Between one-fourth and one-third of patients treated do not respond to them
Progestins	<ul style="list-style-type: none">• First-line therapy• Not expensive• Lower thrombotic risk• Low rates of AEs• Multiple route of administration available	<ul style="list-style-type: none">• Only two progestin approved for contraception purpose (DSG, ENG-subdermal implant and LNG-IUS)• Between one-fourth and one-third of patients treated do not respond to them
Gn-RH-as	<ul style="list-style-type: none">• Secondary-line therapy (efficacious in treating patients who did not respond to COCs or progestins)	<ul style="list-style-type: none">• Not oral administration (subcutaneous)• Expensive• High rate of AEs (estrogen-related)
Danazol	<ul style="list-style-type: none">• Not expensive	<ul style="list-style-type: none">• Low popularity due to the androgenic AEs
Aromatase inhibitors	<ul style="list-style-type: none">• Efficacy in women refractory to other traditional hormonal treatments (should be used only in scientific setting)	<ul style="list-style-type: none">• Expensive• High rate of AEs (myalgia, osteoporosis etc.)

GnRH-as = gonadotropin-releasing hormone agonists; GnRH-ant = gonadotropin-releasing hormone antagonists; AE = adverse effect; DSG = desogestrel; ENG = etonorgestrel; levonorgestrel releasing intrauterine device

Management

New oral hormonal therapy - GnRH antagonist

Clinical Benefits of GnRH Antagonists

- 1 Oral delivery
- 2 Rapid reversibility
- 3 Immediate gonadotropin suppression – no flare effect
- 4 Dose-dependent partial or full estrogen suppression

Table 1. Efficacy and side effect of different doses of GnRH antagonist at 24 weeks.

Assessments	Elagolix				Linzagolix			Relugolix

Elagolix 150 mg once daily, elagolix 200 mg twice daily, linzagolix 75 mg, 100 mg and 200 mg once daily). Patients randomized to linzagolix 200 mg were switched to linzagolix 100 mg at week 24.

Management

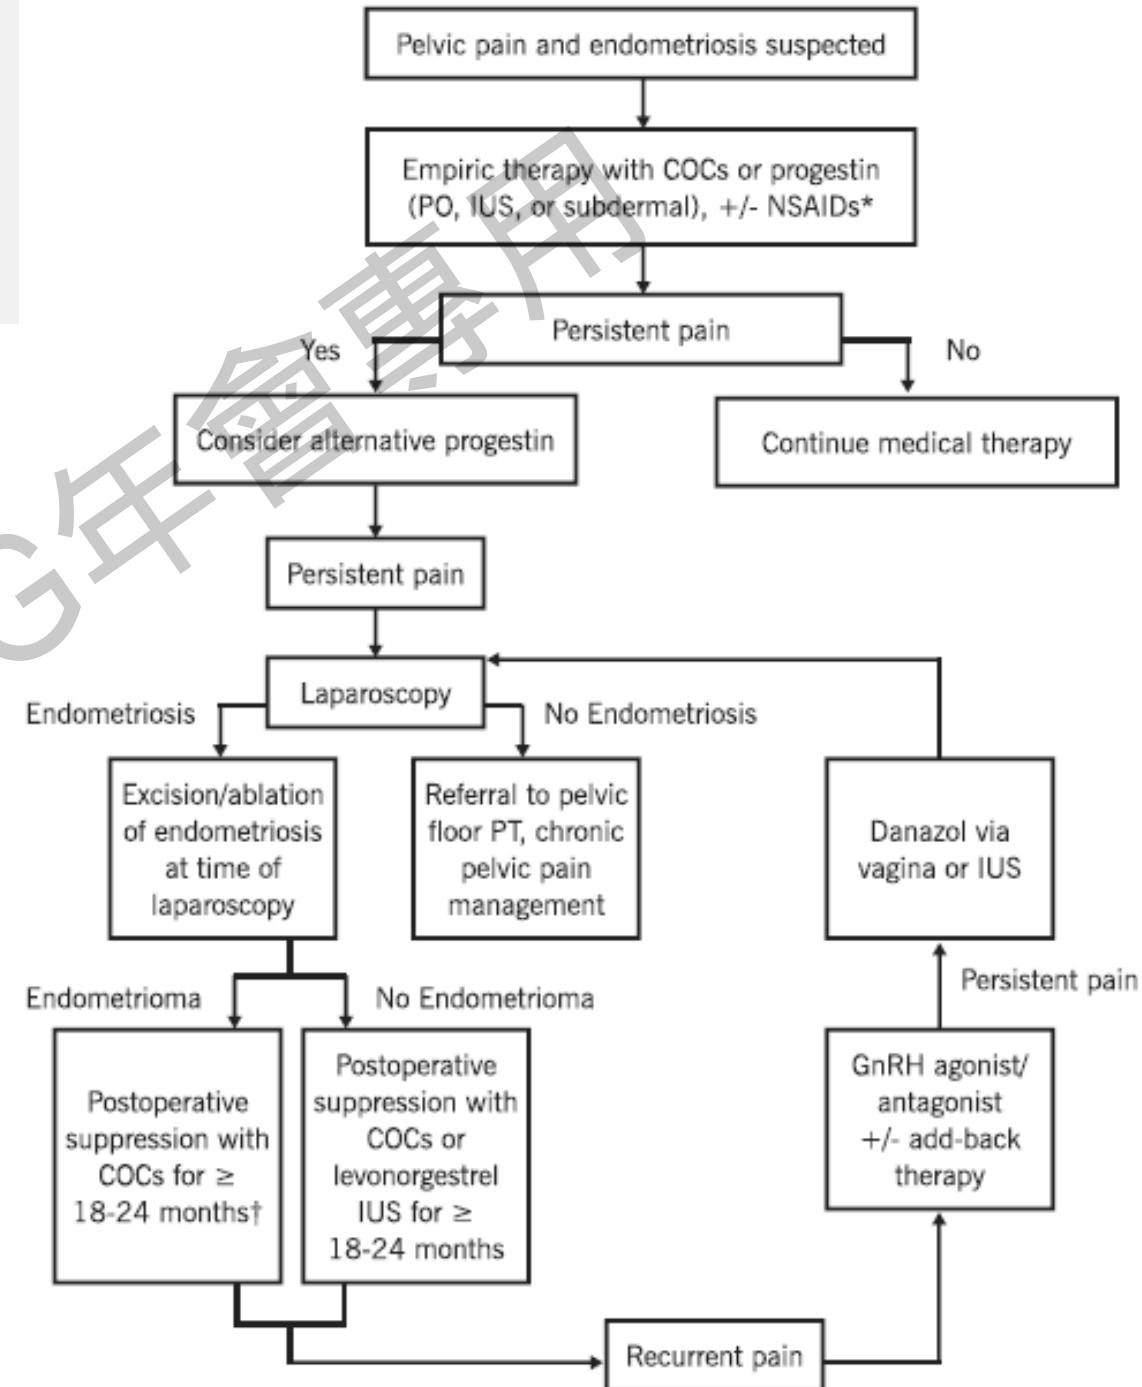

Surgical management

Medical treatment failure
Hollow organ obstructed DIE
Ovarian endometrioma
Infertility

NICE National Institute for
Health and Care Excellence

With post surgery medication

Expert Opin Pharmacother. 2020;21(8):893-903.

Management

Post surgical treatment- Prevention of recurrence

Cochrane
Library

2020

20 studies enrolled for post surgical treatment to placebo or no medical therapy

Pre- and postsurgical medical therapy for endometriosis surgery (Review)

Summary of findings 2. Postsurgical medical therapy compared with placebo or no medical therapy

Outcomes	placebo	Postsurgical medical therapy	Relative effect (95% CI)	
✓ Pain recurrence < 12month	255/1000	178/1000	0.70 (0.52-0.94)	WES: COC prevention of endometrioma recurrence after surgery
✓ Disease recurrence < 12 months	171 /1000	51/1000	0.30 (0.17-0.54)	ESHRE : > 18~24 month recommended
✓ Pregnancy rate	344/1000	409/1000	1.19 (1.02-1.38)	

Adopted from Pre- and postsurgical medical therapy for endometriosis surgery. Cochrane Database of Systematic

Reviews 2020, Issue 11. Art. No.: CD003678.

Conclusion

Often delayed diagnosis

**Lifelong disease,
medical treatment and
avoiding repeated
surgical procedures**

10% recurrent rate a year

Medical treatment

- Non-hormone therapy, NSAID
- Hormonal therapy: COC, Progestin, GnRH agonist/ antagonist, others

Surgical treatment

- Medical treatment failure
- Surgical treatment of endometrioma
- Surgical treatment of DIE

Post operative medical treatment

- Post operation medical therapy for prevention recurrence

34.4 % recurrent rate in 3 years

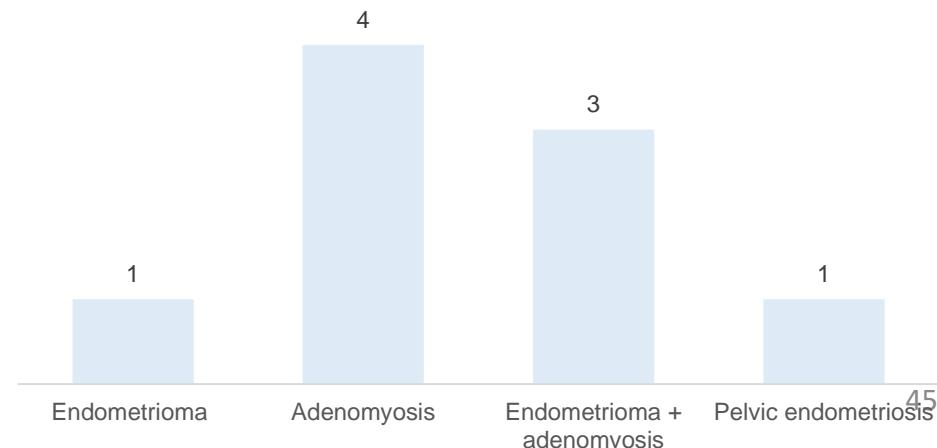

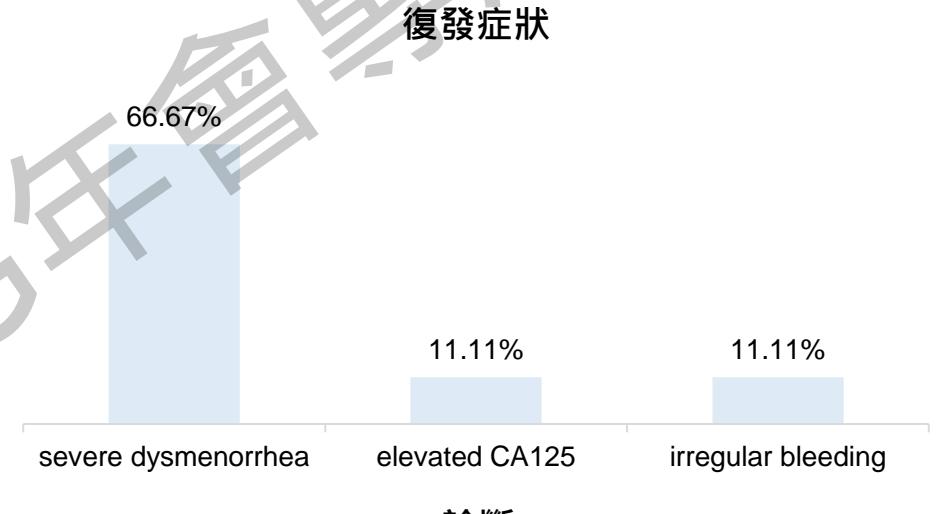

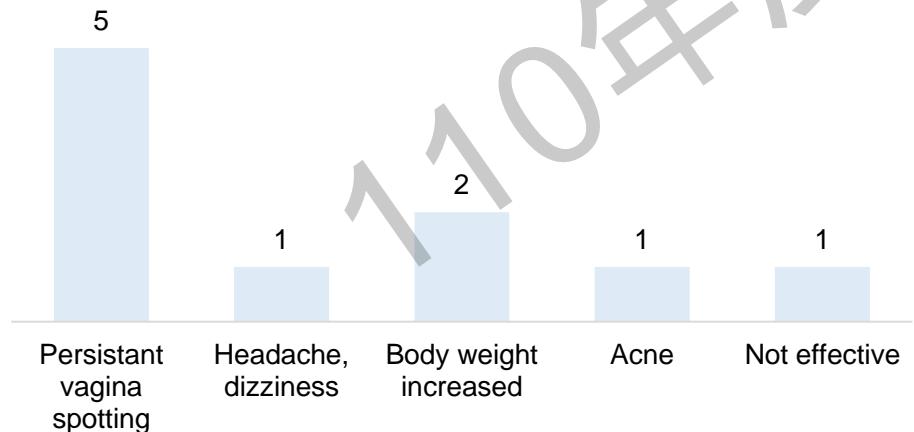

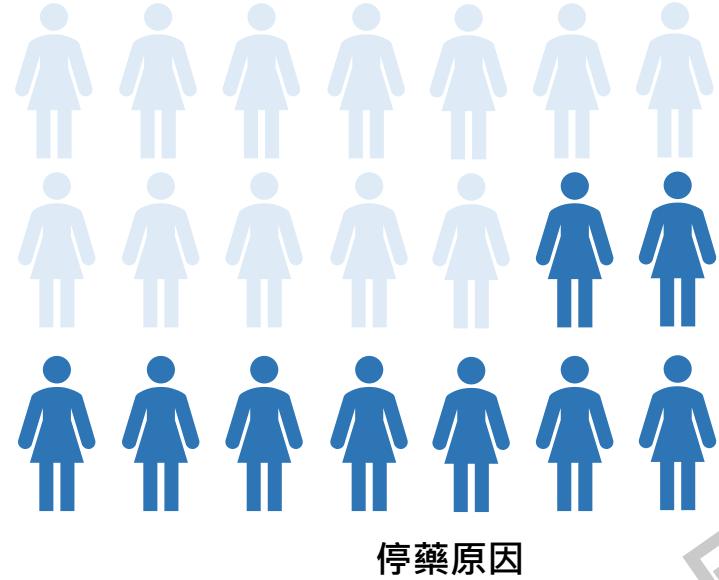

Mean recurrent time 5.62 (4.27-6.97) months

7. 再次使用分析

停藥後再度使用

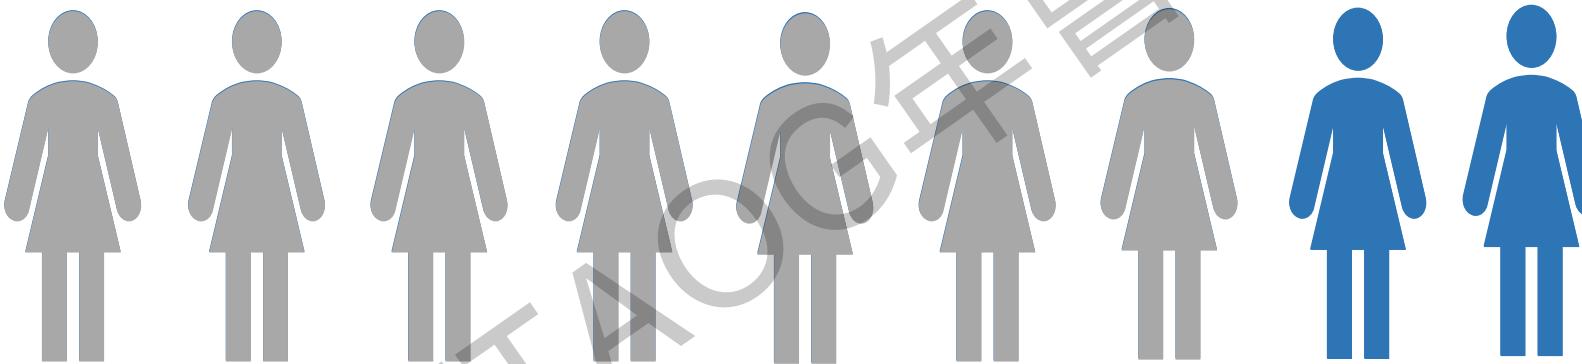

共九人停藥後再度使用藥物
停藥後 **5.6 (2-11)** 個月症狀復發
平均停藥時間 **7.9 (3-11)** 個月後再度開始使用
其中一人三度使用

停藥後再度使用

77.8% patient use other medication before resume Dienogest

77.8%(7/9) choose

Patient	A	B	C	D	E	F	G
NSAID	✓		✓	✓	✓	✓	
OCP				✓			
Gestrin						✓	✓
Danazol							✓

Conclusion

47 % patient in NCKUH cohort with either persistent vaginal spotting or massive bleeding after Dienogest use

Vaginal spotting event will decrease with time, 50% in 5 months

31.1% patient stopped Dienogest use due to persistent vaginal spotting

Symptoms recurred at mean 5.62 months after stoping Dienogest

42.9% patient had resume Dienogest after 7.9 months after symptoms recurred

Thank you for your attention
